

WHAT IS KONDUKTO ?

Konduktio is an application security testing orchestration tool which allows its users to view all vulnerabilities discovered by different application security testing tools (e.g. SAST, DAST, IAST, SCA, CS) and take actions on them from a single platform.

It automates manual processes involved in application security and DevOps right from the identification of vulnerabilities until the remediation and embeds security tests into the entire SDLC to enable a successful DevSecOps adoption.

HOW DOES KONDUKTO WORK ?

Our workflow consists of five steps ;

WHY USE KONDUKTO ?

Understaffed Security Teams

The disproportion between resources of security and software development teams is making it harder for security engineers to keep up with the speed of development. Kondukto comes to rescue by functioning as an extra automated AppSec or DevSecOps engineer.

Variety of AppSec Scanners

The variety of AppSec testing tools adds up to the complexity by creating different interfaces and reports that security engineers need to deal with to analyze large amounts of vulnerabilities and decide which ones pose real threat to the applications. Kondukto instantly provides consolidated dashboards to let security engineers have more time to do value added work.

Friction Between Development and Security Teams

The dependency on software developers for remediation of AppSec vulnerabilities is leading to constant friction between security engineers and software developers whose priorities and skill sets are totally different.

WHAT IS INSTALLATION LIKE?

Kondukto can be used as an on premise solution or on your cloud infrastructure. The installation takes only a few minutes and Kondukto starts its required components as Docker containers and positions itself as an operating system service, which can be controlled via system managers with one command.

KEY BENEFITS

DevSecOps with Open Source or Commercial Scanners

Use commercial scanners or out of the box open source scanners to start scanning your projects right away. Orchestrate scans across entire software development life cycle using Kondukto CLI or interface.

Centralized Vulnerability Management

Centralize all vulnerabilities scattered across AppSec scanners. Instantly take action and track vulnerabilities from a single pane of glass.

Automated Policy Checks

Create automated customizable workflows on issue opening, CI/CD thresholds and notification to ensure risk perception of the organization is strictly imposed on applications.

Speedy and Relevant Remediation

Automating manual tasks and centralizing dispersed AppSec data leads to quicker and more informed decisions that speed up remediation of relevant vulnerabilities.

Corporate Memory

Never lose historical data if you change a AppSec scanner and never have to build integrations from scratch if you change a tool in your DevOps tool chain.
